Micro Denier Felt

2.25 Regular Denier Fiber

0.7 Micro Denier Fiber

- CS & S Filtration and our felt supplier has developed a new “Surface Filtration” product to provide a membrane type performance without the high cost.
- This product utilizes the high efficiency characteristics of “MICRO DENIER” fibers in conjunction with a standard filtration felt to give you this performance.
- These fibers provide a coating on the surface of the filter bag that has a much smaller pore size than conventional felt. However there are many more of these smaller pores providing higher air flows. This reduced pore size keeps fine particulate on the surface of the bag and prevents migration that causes puffing during an on line cleaning pulse.
